

§ 1.4 Properties of probabilities

Let $A, B \subseteq \Omega$ be events. Here are some operations:

<u>operation</u>	<u>notation</u>	<u>description</u>	
union	$A \cup B$	A or B (or both)	
intersection	$A \cap B$ (or AB)	A and B (simultaneously)	
complement	A^c	not A	
implication	$A \subseteq B$	A implies B (or if A then B)	

Example Express each of the following using set operations and draw the corresponding Venn diagram

① A but not B occurs

$$A \cap B^c = AB^c$$

② neither A nor B occurs

$$(A \cup B)^c \quad \text{see worksheet for another way}$$

③ at most one of A or B occurs

$$(AB)^c \quad \text{see worksheet for another way}$$

Def Events $A, B \subseteq \Omega$ are called mutually exclusive if $A \cap B = \emptyset$ (ie. they are disjoint or in other words have no outcomes in common).
 "empty set"

Addition Rule If $A, B \subseteq \Omega$ are mutually exclusive then $P(A \cup B) = P(A) + P(B)$.

Theorem The following properties hold for any events $A, B \subseteq \Omega$:

- ① if $A \subseteq B$, then $P(A) \leq P(B)$
- ② $P(A^c) = 1 - P(A)$
- ③ $P(A \cup B) = P(A) + P(B) - P(A \cap B)$

Proof ① Observe that $B = A \cup BA^c$ and

A and BA^c are mutually exclusive.

$$\begin{aligned} \text{Therefore } P(B) &= P(A) + P(BA^c) \\ &\geq P(A) + 0 = P(A). \end{aligned}$$

② Observe that $\Omega = A \cup A^c$ and A and A^c are mutually exclusive events. Therefore

$$1 = P(\Omega) = P(A) + P(A^c), \text{ which implies } P(A) = 1 - P(A^c).$$

⑦

Observe that

$$A \cup B = A \cup BA^c \text{ and}$$

A and BA^c are mutually exclusive

$$\text{Therefore } P(A \cup B) = P(A) + P(BA^c).$$

Moreover, $B = BA^c \cup AB$ and BA^c and AB

are mutually exclusive events. Therefore

$$P(B) = P(BA^c) + P(AB)$$

which implies $P(BA^c) = P(B) - P(AB)$. Thus

$$\begin{aligned} P(A \cup B) &= P(A) + P(BA^c) \\ &= P(A) + P(B) - P(AB). \end{aligned}$$

Problem 1. Let A, B, C be events. Draw Venn diagrams for the following events and make note of the formulas that you seem to be deriving.

1. $(A \cup B)^c$
2. $A^c B^c$
3. $(AB)^c$
4. $A^c \cup B^c$
5. $A(B \cup C)$
6. $AB \cup AC$

Note for after class. The formulas you derived show that set operations have *distributive* properties. You've derived three formulas but there's a fourth. What is it? Put all four in your notes!

$$\leftarrow A \cup (BC) = (A \cup B)(A \cup C)$$

$$\begin{aligned} (A \cup B)^c \\ = A^c B^c \end{aligned}$$

$$\begin{aligned} (AB)^c \\ = A^c \cup B^c \end{aligned}$$

$$\begin{aligned} A(B \cup C) \\ = AB \cup AC \end{aligned}$$

Problem 2. Suppose A and B are two given events. For each of the following new events, draw a Venn diagram and then express it in terms of A and B using intersection, union, complement, or some combination of these operations.

- At least one of the two events occurs,
- Both of the events occur,
- Neither event occurs,
- Exactly one of the two events occur.
- At most one of the two events occurs.

$A \cup B$

$A^c \cup B^c$

AB

$(AB)^c$

$(A \cup B)^c$

Problem 4. Suppose $P(A \cup B) = 0.6$ and $P(A \cup B^c) = 0.8$. Find $P(A)$.

$$\begin{aligned}
 P(A \cup B^c) &= P(A) + P(B^c) - P(AB^c) \\
 + P(A \cup B) &= P(A) + P(B) - P(AB) \\
 \hline
 1.4 &= 2P(A) + 1 - \underbrace{(P(AB^c) + P(AB))}_{=P(A)} \\
 0.4 &= P(A)
 \end{aligned}$$

Problem 5. Zahkayah is taking two books along on her holiday vacation. With probability 0.5, she will like the first book; with probability 0.4, she will like the second book; and with probability 0.3, she will like both books. Find the probability that she likes neither book. *Make sure to clearly define some notation using sentences and then show your steps.*

Let A be the event she likes the first book and
let B be the event she likes the second one.

$$\begin{aligned}
 P((A \cup B)^c) &= 1 - P(A \cup B) \\
 &= 1 - P(A) - P(B) + P(AB) \\
 &= 1 - 0.5 - 0.4 + 0.3 = 0.4
 \end{aligned}$$

Problem 3. Consider the events A and B from the previous problem and suppose that $P(A) = 0.4$, $P(B) = 0.5$, and $P(A \cup B) = 0.8$. Find the probabilities of each of the five new events of the previous problem.

$$P(AB) = P(A) + P(B) - P(A \cup B) = 0.1$$

$$a) P(A \cup B) = 0.8$$

$$b) P(AB) = 0.1$$

$$c) P((A \cup B)^c) = 1 - 0.8 = 0.2$$

$$d) P(A^c \cup B^c) = 0.8 - 0.1 = 0.7$$

$$e) P((AB)^c) = 1 - P(AB) = 0.9$$

Problem 6. The probability that a visit to a Primary Care Physician (PCP)'s office results in neither lab work nor a referral to a specialist is 35%. On the other hand, 30% of PCP visits are referred to a specialist and 40% require lab work. Find the probability that a PCP visit results in both lab work and a referral to a specialist. *Make sure to clearly define some notation using sentences and then show your steps.*

Let L be the event the visit results in lab work,
let S be the event it results in a specialist referral.

$$\begin{aligned}
 P(LS) &= P(L) + P(S) - P(L \cup S) \\
 &= 40\% + 30\% - (1 - 35\%) \\
 &= 70\% - 65\% = 5\%
 \end{aligned}$$
